

Odds Shopper — Morning Fix Checklist

One blocking task, about 5 minutes. Everything else is already committed. Deadline: CFB Week 0, Sat Aug 29.

STATUS: capture is DOWN — nothing has been written since Aug 18

The RLS lockdown you applied Aug 18 turned on row-level security with zero policies, but **SUPABASE_KEY** in **.env** is **still the anon key**. Every write is denied with `42501 permission denied`. Zero opens and zero closes are being banked right now. Your CFB Desk ledger is down for the same reason — it reads the same **.env**.

Do this first — capture stays dead until you do

I can't fetch the `service_role` key, and you don't want me handling it. This is the whole fix.

1 Copy the `service_role` key []

Supabase > Project Settings > API Keys > copy **service_role** (the secret one). Not anon — anon is what's broken.

2 Paste it into `.env` []

Set `SUPABASE_KEY` in this file:

```
C:\Users\The Work Station\Documents\All AI Stuff\
odds-shopper\.env
```

This one file fixes both odds-shopper and cfb-agent.

3 Paste it on all 6 Render services []

Web service plus all 5 crons: `ncaaf-sunday`, `capture-sat`, `capture-late`, `nflpre-open`, `nflpre-close`. Render never gets these from git (`sync: false`), so each one needs it by hand.

4 Verify — expect 99 opens and exit 0 []

```
cd "C:\Users\The Work Station\Documents\All AI Stuff\odds-shopper"
python capture_cron.py
```

Good: `opens_recorded: 99`, `write_failures: 0`, `exit 0`.

Still broken: any FATAL line, or `opens_recorded: 0`. It now says which.

Then confirm rows actually landed, in Supabase SQL:

```
select phase, count(*) from line_snapshots group by phase;
```

Already fixed and committed — don't redo these

The second bug: the cron was reporting success while writing nothing

`run_capture` counted *games*, not successful *writes*. Before the fix, a run where all 198 writes were denied still returned `opens_recorded: 99, errors: [], exit 0` — Render marks that green. You would have watched six healthy-looking crons straight through Week 0 and found an empty table in October. That's what made this urgent, not the key itself.

Commit `cb6719a` — "Fix silent capture failure: count writes, not games":

- `app.py:535` — snapshot functions return `(ok, error)` instead of swallowing the exception into a log line nobody reads.
- `app.py:610` — counts successful writes only, and dedupes errors (one bad key was producing 198 identical lines).
- `capture_cron.py:25` — exits non-zero on an anon key, *and* on any run that sees games but banks zero opens.
- `/api/info` — now reports `sb_key_role` and `can_write`. Its old probe was a `SELECT`, which can read "ok" on a key that's denied every `INSERT`.

Verified against live odds before and after

Before: `games_seen 99, opens_recorded 99, errors [], exit 0` — while writing nothing.

After: `games_seen 99, opens_recorded 0, write_failures 2, exit 1` — the truth, with the 42501 cause named.

Two open items — your call, not blocking capture

Repo is still public

The anon key is in this repo's git history. Now that RLS is on it can't write, so it's no longer a live hole — but making the repo private is `DEPLOY.md` step 4 and worth doing while you're in there.

Closes are 15–30 min stale

`ODDS_API_KEY` is commented out (free tier exhausted 500/500 on Aug 17), so you're on the ActionNetwork fallback. Fine for opens. But a delayed close is a worse number to grade against, and beating the close is the entire point of the CLV track record. Worth settling before Week 0.
